

## **Syniti ADM Course Content**

1. **Waves, console, process areas** - Navigate through various waves related to business process areas. Waves are specific to a migration project and are a container where all the tasks related to a migration project are carried out.
2. **Design** - Creating your targets for migrating various objects. Importing fields, creating additional fields, changing data types etc.
3. **Mapping** - Creating field wise mappings and applying transformation logics.
4. **Transform** - Run and monitor your targets. Create preload, postload and error reports. Generate load files.
5. **Automation** - Register source and target tables, Create source and target rules, Primary key constraints etc.
6. **Collect** - Register packages to extract source data, schedule the extraction jobs, create where clause to restrict data extraction to only relevant data.
7. **Assemble packages** - Understanding and creating Assemble packages to extract source data using complex queries and upload flat files.
8. **Construct pages** - create construct pages to upload exclusion/inclusion lists. Create interactive reports demonstrating the overall migration status.
